18.01 Solutions for Practice Questions (Exam 1)

[1] a) By quotient rule:

$$\frac{d}{dx} \left(\frac{\sqrt{x}}{1+2x} \right) = \frac{\frac{1}{2\sqrt{x}}(1+2x) - \sqrt{x} \cdot 2}{(1+2x)^2}$$

value at $x=1$: $\frac{\frac{1}{2} \cdot 3 - 1 \cdot 2}{3^2} = -\frac{1}{18}$

b) By product rule:

$$\frac{d}{du} (u \ln 2u) = 1 \cdot \ln 2u + u \cdot \frac{1}{2u} \cdot 2 = \ln 2u + 1$$

[2] a) By two uses of the chain rule:

$$\frac{d}{dt} (1 - k \cos^2 t)^{1/2} = \frac{1}{2} (1 - k \cos^2 t)^{-1/2} \cdot (-2k \cos t) \cdot (-\sin t)$$

$$= \frac{k \cos t \sin t}{\sqrt{1 - k \cos^2 t}} \quad \text{OR} \quad \frac{k \sin 2t}{2 \sqrt{1 - k \cos^2 t}}$$

[b] If $k=1$, $\sqrt{1 - \cos^2 t} = \sin t$, so the above becomes $\cos t$ which agrees with

$$\frac{d}{dt} \sqrt{1 - \cos^2 t} = \frac{d}{dt} \sin t = \cos t$$

[3] $\frac{d}{dx} \left(\frac{1}{x^2} \right) = \lim_{\Delta x \rightarrow 0} \frac{\frac{1}{(x+\Delta x)^2} - \frac{1}{x^2}}{\Delta x}$

$$= \lim_{\Delta x \rightarrow 0} \frac{1}{\Delta x} \left(\frac{x^2 - (x^2 + 2x\Delta x + (\Delta x)^2)}{(x+\Delta x)^2 \cdot x^2} \right)$$

$$= \lim_{\Delta x \rightarrow 0} \frac{-2x\Delta x}{(x+\Delta x)^2 \cdot x^2} = \frac{-2x}{x^4}$$

$$= -\frac{2}{x^3}$$

[4] $y = \sin^{-1} x \Rightarrow x = \sin y$

Differentiating: $1 = \cos y \cdot \frac{dy}{dx}$

$$\therefore \frac{dy}{dx} = \frac{1}{\cos y} = \frac{1}{\sqrt{1 - \sin^2 y}} = \frac{1}{\sqrt{1 - x^2}}$$

(Since $-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$, $\cos y \geq 0$ so use positive $\sqrt{\quad}$)

[5] Since $f(x)$ is differentiable, it is also continuous. Thus the two functions must have same value at $x=1$ (in the limit), and the same slope (in the limit):

$$ax + b = x^2 - 3x + 2$$

value: $a + b = 0$

slope: $a = 2x - 3 \Big|_{x=1} = -1$

$$\therefore a = -1, b = 1$$

[6] a) $\lim_{u \rightarrow 0} \frac{\tan 2u}{u} = \lim_{u \rightarrow 0} \frac{\sin 2u}{2u} \cdot \frac{2}{\cos 2u} = 1 \cdot \frac{2}{1} = 2$

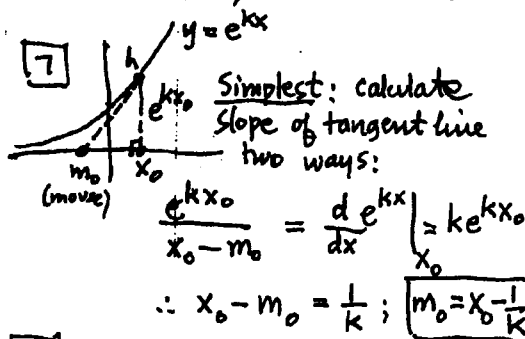

(another way: $\lim_{u \rightarrow 0} \frac{\sin 2u}{u \cdot \cos 2u} = \lim_{u \rightarrow 0} \frac{\sin u}{u} \cdot \frac{2 \cos u}{\cos 2u} = 2 \cdot 1 \cdot \frac{1}{1} = 2$)

b) $\frac{d}{dx} e^x \Big|_{x=0} = \lim_{h \rightarrow 0} \frac{e^{0+h} - e^0}{h}$

(can use Δx instead of h) $= \lim_{h \rightarrow 0} \frac{e^h - 1}{h}$

But $\frac{d}{dx} e^x \Big|_{x=0} = e^x \Big|_{x=0} = 1$

Therefore, the limit is 1.

[OR] Equation of tan. line is $y - y_0 = k e^{kx_0} (x - x_0)$; $y_0 = e^{kx_0}$

The x-intercept m_0 is where $y=0$
 $\therefore -e^{kx_0} = k e^{kx_0} (m_0 - x_0)$ ($x=m_0$ there)
 so $-\frac{1}{k} = m_0 - x_0$, $m_0 = x_0 - \frac{1}{k}$
